Atari denies 8 bit customers ignored

ATARI has denied that it is treating 8 bit customers as poor relations. The criticism was levelled against Atari during a poll of 900 users drawn recently from the ranks of 800X1 and 1300X2 owners.

More than 80 felt the company had turned its back on the 8 bit machines in favour of the ST range.

Typical of the comments:

THIS Atari version of the Zaxxon robot has been launched by Intergalactic Robots. It is an educational model designed to teach users the fundamentals of robotics and can be used as a Logo turtle. It costs £119.95.

was. The owner of the ST machines insist that Atari just doesn't want to know us any more. It is annoying when you think that although the ST may be the king on the table we make up the table itself.

When the disestablishment among 8 bit users was brought to the attention of Atari boss Mike Barnidge he was quick to give assurances that the complaints were unfounded.

However he did admit the publicity had not succeeded in the arrival of the ST machines has resulted in just the less powerful models in the shade.

Sensitive

We are very sensitive to this, he told Atari User. We are not only so we want any of our customers to feel as though they are being treated any less fairly than others.

The truth of the matter is that we are totally committed to

the 8 bit market - just as we are to the 16 bit.

Mike Barnidge points to the launching of a new low cost colour monitor for the 1300X2 as being an example of the company's on-going support.

It is an intention to see that the 1300X2 remains the leader in its own sector of the market, he said.

As part of this plan the Atari UK boss has pledged his support for companies wishing to develop projects for the 8 bit machines.

We are eager to help anyone in this area whether it be with the type of development machines, programming tools or just advice, he said.

That's how important the 8 bit market is to us.

ST TOOLBOX

A COMMAND programme has been released for the £205 by Paparidge.

Called the ST-Toolbox it is a productivity tool aimed at enhancing the machine's efficiency and performance. It costs £29.95.

Backing for Atari projects

HALF a million pounds is available for projects for the Atari range. The man with the money wanting investment is Barry Brits, managing director of Decoder Systems.

I am prepared to invest in likely looking projects existing ones that may need a boost to try which still may be at the final stage, he says.

As a nation we are collectively good at ideas but terrible at putting them into practice - when through lack of capital.

Decoder Systems manufactures the Magic Modern. It was this project with its heavy development costs which led Barry Brits thinking about investing in his own personal venture capital fund.

Flounder

Remembering the problems he had to deal, 'the machine floundering' it would be easy for an exceptional product to flounder if you did not have enough capital backing it.

Usually there is no one out there you can turn to if you do not have money available.

That is why I decided to make the offer not just for profit for myself but to help the industry as a whole.

GAMES BOOM IS ON ITS WAY

THIS year will witness a massive increase in the amount of software available for the Atari 8 bit machines, the 800X1 and 1300X2.

An industry survey carried out by Atari User has revealed that the boom is already underway with at least 100 new titles expected to come on to the market in the next few months.

More programs - and more outlets stocking them - should end the longstanding complaint by Atari 8 bit enthusiasts that software for their machines is often hard to find. There are two

main reasons for the biggest influx.

One is the deal with High Street giants Dixons and Currys, which announced the 800X1 sale, for 100,000 in December. The second reason has to do with the ST bit titles from the United States.

Software Express distribution director Ian Howells told Atari User: A lot of software companies have suddenly realised there is a big market for products for the Atari 8 bit range.

Forces that previously wouldn't have bothered to

convert their titles for the Atari are now doing so in increasing numbers and programmers all over the country are being snowed under with commission work.

American software houses are licensing large numbers of their Atari 8 bit programs to British firms. Some are even opening their own offices over here.

We are in the process of introducing 50 new titles to the country, many originating in the USA and I expect that total to be easily doubled by releases from other companies.

Two or three new titles a week are contacting us to order Atari programs. If any users have problems getting Atari 8 bit software these days they should change their retailer.

Distributor Microdeal reports that all its Atari 8 bit software is selling extremely well.

A spokesman said: 'We carry 60 titles at the moment. Perhaps we should be handling more - there is obviously a big demand for them.'

Since Sheep is currently releasing 30 new products, many of them American imports for Atari 8 bit machines -

► Activate ► Atari's ► hidden ► depths ► of sound

STEPHEN WILLIAMSON invites you to turn up the music

INSPIRED by years of listening to the electronic sounds of rock groups like Teengame Dream and Pink Floyd, I have written a synthesizer program that activates the hidden depths of the Atari sound chip.

It may not be up to the standard of Jean-Michel Jarre, who uses electronic sound-generating equipment costing many thousands of pounds, but the program is certainly fun to play with.

For best results connect your Atari directly to your stereo system via the monitor output and suitable leads. Alternatively use a television with an earphone output and connect this to your amplifier. Turn the volume up.

Fortunately you don't have to know a great deal about music or even computers to operate the program and produce a wide variety of sound ranging from the melodious to the cacophonous.

To control the program I have created Atari's big brother, the ST. Well I admit that the program is not quite as sophisticated as the ST, but the principle is the same. The joystick acts as a game mouse interface. Each screen display presents a number of options. The joystick moves a cursor to the chosen option and a press of the fire button activates that option.

The user-friendly approach is an ideal way for those unfamiliar with computers or the overly keyboard to operate the program. Inverted characters indicate that an option has been selected.

For example, go to the One Channel Sound page and you will find that the sound is set at 4.84kHz (near bass drum and gun sound). To switch on other sound attributes the cursor can be positioned anywhere on the line where the chosen option appears.

The program will not allow you to switch on incompatible options. For instance, if you switch on Distortion2 any other distortion option previously turned on will automatically be cancelled.

When the desired combination of sound attributes has been chosen place the cursor over the Play button and press the fire button. Control then passes to the middle line rows of the keyboard.

The display at the bottom of the screen plays chords from the musical

notes have been allocated to the keys in a similar way to the piano keyboard with the sharps positioned above the natural notes.

The musical scale is true for the preset sounds, but other sound options may give various degrees of discord.

To exit from the play mode press the Select key and a keyboard music key at the same time. To return to the main menu go to the Return box.

The ADSP section enables you to define a sound envelope. If you are unfamiliar with the ADSP envelope study Figure 1 which shows a graph of the sound envelope.

Attack is the time taken for a note to reach full volume and Decay the time taken to reach the Sustain Level. Sustain is a measure of how long the note stays at the sustain volume level before the release when it fades to silence.

When the cursor is over one of the ADSP labels at the bottom of the option menu and the fire button pressed the label will flash to prompt a keyboard input. For Attack, Decay, Sustain and Release, enter a value of between 1 and 255. If the number is less than three figures press the joystick button or the Return key to gain control of the program back to the joystick.

The Sustain Level requires a value of between 1 and 14 and only needs the joystick button or Return key to be pressed if a single figure is entered.

The program will not allow an invalid number to be entered in the ADSP envelope parameters. To demonstrate, the ADSP sound envelope enter Attack 3, Decay 10, Sustain 40, Release 50 with a Sustain Level of 9 to produce a crisp piano type sound.

To obtain a woodwind type sound try Attack 30, Decay 30, Sustain 50 and Release 60 with a Sustain Level of 9.

A more drum type sound is made by setting the 84kHz clock (option 1) the 1.79 mHz clock (option 4) the Duration 3 (option 8) and the 9 bit poly-counter (option 9) followed by Attack 5, Decay 5, Sustain 5, Release 10 and Sustain Level 5.

In order to understand what each of the program options does it is useful to know something about how the Atari sound chip functions. (For a more detailed introduction to the

subject see the May and June 1985 articles in Atari User by Peter Biddy.) In Basic there is only one command to control sound – called appropriately enough SOUND. As well as addressing the sound system by means of the command it is possible to work directly on the sound registers which are found at addresses \$3780 to \$3785.

\$3780-\$3783 \$3784 and \$3785 control the pitch of sound channel 0 to 3 and addresses \$3781-\$3785 and \$3787 affect the distortion and volume for each sound channel.

For example, a note can be switched on using a command such as SOUND 0,80,10,10 or alternatively the same sound can be achieved by POKE \$3780,50 followed by POKE \$3781,204.

In the program the play mode runs

Figure 1: ADSP envelope

a machine code routine that detects which key has been pressed and allocates a pitch value which is stored in the sound channel 0 register at address \$3780 and in the case of the two channel sound, calculates a pitch value in octave bits which is put in the sound channel 1 register at address \$3785.

This routine also handles the timing and volume controls during the ADSP section.

Options 5 to 8 decide which distortion value is placed in the distortion and volume registers at address \$3781 – if the two channel mode is chosen a similar distortion and volume value is placed in address \$3785.

Address \$3786 is known as AUDCTL and affects the sound channels in ways that cannot be described directly from Basic. Options 1 to 4 and option 9 change the value contained in this address to give various effects.

Normally the Atari sound is

generated using a 64kHz system. The lower the frequency of the clocking the lower the note that results. Therefore lowering the 64kHz clock to 15kHz by choosing option 3 changes AUDCTL to give notes of a lower pitch.

The 1.79mHz clock (option 4) gives notes of a very high frequency.

The high bandpass filter (option 2) filters out lower frequency sound to give a higher tone.

During the distortion options (5 to 8) the distortion effect is achieved by something known as a poly-counter which generates random waveforms with pure sounds.

The value of the poly-counter affects the speed of these waveforms. Normally the Atari is set to a 17 bit poly-counter.

To see this in operation switch on distortion number 3 in the One

Channel mode but without the 9 bit poly-counter. Enter the Play mode and press Key L.

Exit from the Play mode and switch on the 9 bit poly-counter. Again press key L. In the Play mode and you will notice how the change of poly-counter speed affects the distorted sound.

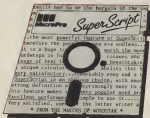

Of course when using pure sound the 9 bit poly-counter has no effect, and in other distortion and poly-counter combinations the change may be difficult to detect.

Option 10 Repeat is used only during the ADSP section and, as the name implies, causes notes to be repeated rapidly.

The best way to use a program like this is to experiment and see what you can find among the Atari's vast range of sounds. Have fun, but spare a thought for your neighbours.

Note: The program will not run on a 768 machine.

Have fun with the Nurds

WHIRLWURDS is one of the latest releases from US GOM, who have a reputation for quality Atari software. This is no exception.

The plot behind the game is that the four Nurd brothers have run out of food and decide to raid their friend's house, a greenroom called Squash.

He is on holiday and has boobytrapped his house and the Nurds have to evade the traps and eat all the food.

Whirlwurd is basically a game of exploring rooms, avoiding traps and getting power. It may sound all too familiar but is in fact significantly different from other such games.

It is far less a four players who can work individually or as teams.

In consists of 50 rooms each with a different set of problems or traps. You can start at the beginning of any block of 10 rooms by selecting A-E at the start.

However the last 10 rooms are known as the ultimate floor and can only be entered by means of a password. This is gleaned in four parts by completing each of the previous groups of 10 rooms and is not easy.

Each room seems an area equivalent to almost any screen and the area shown on the screen scrolls very smoothly as you approach the edge.

You can imagine 50 rooms like this mean that the game is big and will not be exhausted quickly.

Your man is a Nurd, a squat, gump figure with a stupid grin and a propeller stuck on his head.

The four players are known respectively as Raymush, Puppkin, Nipples Nerd, Housley Nurd and Marvin Luggly. They are identical apart from the colour of their shirts.

The control of your Nurd is quite novel. When walking it is standard — he will walk left when the joystick is pushed left and right when the joystick is pushed right. However

when the trigger is pressed the propeller starts to rotate and your Nurd will begin to spin.

If you release the trigger or if he hits a wall or platform he will begin to decelerate slowly and will not run again until he has had his feet on the ground.

He does have an emergency super jump which can be obtained by pushing the stick up. This is called a wury boost.

You get only one life per screen or life and have had a small problem.

It is far too easy to accidentally use this leap in the excitement of play and jump straight into disaster or

at the least be depressed for later use.

Your start is represented around the room collecting food. Strange creatures, Nurds — they eat anything from power to light bulbs and toys etc.

The walls, platforms and floors are safe to land on or bump into, but everything falling is deadly.

These hazards are seen only when you include clock markers, bag men, jump bugs, gobs, squabs and the People of Squab.

In addition there are keys which can be used to unlock closed off areas of the rooms but beware — they can also

unlock further hazards. Small boxes on the floor known as item squares will give you the same effect as a super jump but also use up your ability to perform these at will.

The graphics are very good if not spectacular especially the Nurds. They turn slowly in a 3D effect on changing direction.

The sound effects are also good and add considerably to the feel of the game.

The background music especially adds to the excitement. As the time limit for each room runs out the music gradually quieters, adding a sense of urgency in your play.

There is also a special level in which the rooms are movable, adding to the challenge. The Nurd has a lock illuminating only a small area around him.

Whirlwurd is certainly well worth the price of £19.95 or £12.95 outside. It is novel and has a definite goal to achieve which I feel always keeps a game's interest alive.

I certainly don't think it dies of this quality.

Some of the rooms are extremely difficult and will keep even the most experienced player occupied.

Malcolm Ross

Living dangerously in the city

GOM don't come across many fence role playing games for home computers, and I don't class adventures as being in that category so when an advert on the scene it's well worth taking a closer look at.

Alternate Reality is such a game and is the best of its kind I've seen. It has excellent graphics, bags of action and options and uses music to good effect.

You are born boobytrapped by aliens and dumped in a room with only one exit. At the start you are presented with a view of the rest game through which the impressive city of Rebel's

Design can be seen.

Several characters follow and soon you are described in detail and you can draw your own conclusions about the city's safety.

Now the game which is itself saved by a time ball are a collection of revealing numbers. These relate to your individual characteristics — strength, intelligence, stamina, charm, wealth, wisdom, skill and hit points.

As you pass through the gate the numbers freeze and those values then determine your character's attributes. The higher the numbers the better your character.

The aim is to explore the city, increase the value of your attributes and above all survive.

During the first few days (game time) you are very

valuable to feel play as they take care to build up your qualities gradually.

Details of your status can be pulled up by pressing the Select key at any time. Movement through the character city is controlled by joystick or keyboard.

All other items include mostly single characters: are entered through the keyboard.

Your current position in the city is shown in the top left of the screen; the lower portion being reserved for commands, options and other text.

Much of the city consists of walled avenues. Close inspection of any wall may reveal the entrance to a building or even a secret passage.

When you enter a building the screen changes to show a three-panel view: often oriented at the building's inhabitants and actions.

There are many buildings in the city. Some are for you rest and recuperation time, offer lodgings and give time and date information.

Taverns whose menus change hourly sell food and drink. Alcohol as you'd expect must be taken in moderation. Get drunk and your movements will be inhibited — you may even black out.

Sometimes easily detected by the sound of its metal being struck, portable weapons, knives and quips may vary and you'll almost certainly need to haggle.

You can earn interest on your money by lending it in a bank and can exchange gems for cash. Shops sell a variety of clothes and goods, mostly ornamental. If you believe it or succeed with a trade.

Weapons can be magical (elemental or cursed) or just normal and can be found or purchased. If you want to rid yourself of a cursed weapon try a trade.

There are many life forms in the city. Guards, gladiators, merchants, thieves, magicians, assassins and thugs are just a few. All have their own specialties.

The world is reported to be the legendary Night Barker, an extremely powerful mage, one of the right.

Encounters are common

and take one of five forms — you surprise a life form or surprise you, you can each other at the same time it sees you first or you see it first.

At an encounter you are either engaged or disengaged. Engaged means you do battle and options include lunge, attack, parry and avoid attack.

If disengaged you may be less skilled means — attack or lunge against for a single. The size of magic cannot be

used out either.

Other hazards include being possessed by a variety of demons — the being shared by a polymorph, illusion and sending a disease — such as contact with magical system of magic.

Persons can be captured and take four forms: benign, intelligent, disorientated and dangerous. Each can be opened, examined for colour, speed and used. All

text is presented in color. English type and musical effects are used throughout the game. Both add to the atmosphere while the later can hold class — the songs played in the tavern after specific important events.

The city is intended to be just the first in a linked series and since you can save and later reload your character, the more you can return any character for use in later releases. Future additions include the dungeons will destroy areas and police.

The game player is totally mainly because it has to make no saving decisions to the disk during play like program and data is spread across four sides of four disks.

That apart it is very enjoyable. The atmosphere, detail and presentation (the wide variety of content and the planned expansion make this) Alternate Reality is available by at £19.95.

Bob Chappell

Spellbreaker's something

ONCE upon a time when I was but a mere adolescent neophyte to whom the word give meant nothing, I had the good fortune to finish the end of the book.

He was an ambitious writer, aspiring to write the world's most famous book. I managed to illustrate his little game, my imagination expanding when others were learned had failed.

For my efforts, I was admitted to the famed Circle of Exchanges and regarded as second only to the great Nelson.

Then Nelson himself landed in the next soup and I had my work cut out trying to move him from the clutches of the odious Jester. There's how I came to be where I am today, top dog of the Circle of Exchanges.

Having thus completed these two superb labours, old-fashioned **Spellbreaker** and **Barbarian** (rated an standard and advanced level) it was

with anticipated pleasure and a touch of surprise that I took delivery of the third in the **Spellbreaker** trilogy: **Spellbreaker**.

Those slithering people at Software Experts wired their magic wand and sent a renege copy of **Spellbreaker** winging towards me as soon as it arrived in the UK.

Removing the usual glossy and handsome box from the sturdy packaging my eyes fell on two words which gave the old game power for thought — **Expert** level.

Spellbreaker begins in the council chamber of Berphea where the Goldmasters are up in arms. You stand at the edge of the gathering, listening to the complainers.

Smellie the Laker means that he has had to make his better parties by hand. He's just finished of getting a black spell to fend the party. It's time to go to bed, the party is no longer reliable.

Finally, the Laker gives you the first of his spells, the

not working either and as a result he's getting angry. He's been told that he's not the best leader his group have been getting in it.

Complete the fantastic says and words are overrunning the town. The Froggy spell no longer keeps the animals outside the boundaries and only nearly one of his men was attacked by a troop of orcs.

The Guild then, the Circle of Exchanges have a lot to answer for and many questions, consequently in you.

After the first starts to speak about magic, rhythm and spelling and when he's told of the spiritual power, which just as he's speaking, he's a psychological and in fact, however he has gone (and goes) greater than you. He's the only one who's not. He's the only one who's not. He's the only one who's not.

He's not alone — all the Guild have turned on him. He's the only one who's not. He's the only one who's not.

The ST deserves better graphics

LANDS of Haven was one of the first graphics games out for the ST. Not surprising though, as it is a translation of a program for the Sinclair QL which won a 500,000 microprocessor in your ST.

This is a graphics adventure game boasting over 2000 screens. The theme is set out in a small, attractively printed booklet.

The land of Haven which was cursed for its benign magician High Wizard, has been turned into an evil land known as The Dark Lands.

You play the role of Sedor-hall man - half magic and have to find your way around the evil, following clues and instructions left by the

magician. The program is well packaged in a sturdy box which also contains nine colour maps.

The game starts by setting out the main areas. There maps cover in a random pattern and you try out the maps in the same pattern.

Each map contains more screens giving a total of 21 screens to explore in the opening section.

The screens are smaller, consisting of passages and openings separated by walls.

The walls in each screen are always made up by the same blocks of graphics characters in one colour only.

However they vary from screen to screen and are effectively detailed. The pass-

ages are indicated by various markers, including symbols and ghosts who try to attack you, requiring your magic or combat.

You have a gun but can only fire occasionally. The creatures move smoothly and are vividly animated but, unfortunately Sedor-hall's body in this

part of the game you must find the entrance to the following part by collecting or touching various marks in a specific order.

Instructions are given as you go along after finding the first item, the Book of Change, which is the most difficult to spin.

As you find objects the creatures chasing you get faster and more deadly.

After the first 21 screens are completed you are transported to the underground caverns the Land of the Falls.

The graphics and game is similar except that the walls are all in one colour.

Here you must collect five tokens and then touch the portal to the next section.

By now the creatures are even faster and are difficult to avoid.

The issue of savegames is challenging as you can often see where you want to be but may have to break into many rooms in a round-about fashion to get there. I suggest you make a map as you go along.

On completing this task you enter the Book of The Dark Lands. This is similar to the last section except more difficult still.

You are told that here you must destroy The Lands by touching all nine of them. In truth - your gun has no effect on them.

This is as far as I have been able to reach. The game is obviously considerably larger because when killed off I was told that I had only completed 2.5 per cent of the adventure even at this stage.

Overall the program is somewhat disappointing considering the capabilities of the ST. Graphics are mediocre sound consists of occasional noises although the music is good. The flickering is not really good enough.

On the plus side the plot is good and it is quite playable but with little variety.

At £18.95 it is a good value. Having said the game was a slight let down, I still have the urge for even more to get further on - this is often the sign of a game with lasting appeal.

time. All except you - and one other - a shadowy figure in a dark cloak who sits out of the door. You pursue him to the town square where the disappears, resurfaced in a cloud of orange smoke, leaving behind some the amber flag has disappeared nothing but a featureless white cube.

And so the battle of good against evil begins. Magic is going very, it is your task to get to the root of this paralyzing light, that threatens to destroy the kingdom.

Your journey will take you to strange places where you'll meet such strange beings.

Attaching the sinister capabilities you'll encounter a tall, red-robed wizard whose faceless body forms a huge hole through three hundreds of years.

Another is a beautifully detailed mountain ogre. He has brilliant purple orbicles and hair matted down with something slick and pungent.

Watch out for a not the

wire of an elephant whose hanging leg is half as big as a small wagon.

As well as a litigious magic book (arguing foul) you also start out with your indispensable book of re-usable spells.

Other spells can be added to the book by finding spell scrolls, of which there are many scattered around the kingdom, and then writing them into the book by using the special Quartz spell.

Some spell scrolls are too powerful to be written in the book. These spells can be cast directly from the scroll but will only work once.

If you're played *Frontiers of Science* you'll be familiar with casting such spells as *Yawn* (fatal probe), *Reave* (Open a locked or anchored object), *Free* (light from an object) and *Meld* (combine).

There are plenty of new ones too - *Free* (close *Candy*), *Break* and *Glaze*.

This is Infocom's 11th

adventure and the standard remains as high as ever - just how many companies can you recall that have produced almost a score of first-rate pieces of software in a row?

They've even added a new command to their already sophisticated parser.

If you type in a sentence with one word wrong, for example *Put the silver cube in the green box*, you can correct yourself simply by adding your next command *DOES word* (DOES = does). This saves you typing in a long sentence all over again.

A gripping, more huge vocabulary - over 800 words - plus descriptive prose, tantalising puzzles and delightful humour. It's a word Spellbinder.

Don't being about - *Frontiers* your doubts. Mobyen those legs down to the nearest phone and order *Spellbinder* from Software Express or your local dealer now.

THE Adrian Mole Industry that has grown up around the Blue Townsend books was certain to spawn a computer game.

The Secret Diary of Adrian Mole arrived from Mosaic Publishing on tape for the Atari 486 range with a dog-headed toothbrush and shaving kit depicted on the cover, advertising the rather slim impression creditable of Level 9 on the programmers.

The blurb to the game is predictably in Mole-ese something I will try to imitate. It comes in four parts and you have to meet Adrian in his quest to become more popular.

The Mole with a personality crisis?

By Brillig

Alternatively, as the game suggests, you could try to become an unpopular as possible.

Each chunk of game covers three months of the unfortunate Mole's life. You are presented with a scrolling diary in the normal Level 9 text fashion below the now obligatory graphics.

Occasionally you are asked to select a course of action for Adrian to follow from the three or four provided. Sometimes you are given a percent age score and a comment as to your status.

And that is about all that does happen. It is a shame that such a good idea has been wasted.

The text is excellent, not only as you would expect from the best selling books, but also from the extra text added by Pete Austin.

But the graphics serve as the top

side nothing to the atmosphere of the game, and yet its very existence results in the increased requirement of the "Press any key to continue" prompt which dogged my progress throughout.

The scoring routine adds little either, firstly because the remarks are rather tedious, and secondly because as it appears as a prompt during the diary you can not see how your actions are affecting the score.

I must stress that at times the game did make me laugh at the antics of Master Mole. The beauty of the books however was that the themes were developed throughout, with notable hilarious incidents woven around them. In the game the themes such as Mrs Mole leaving home and the school episode become small incidents that suddenly happen. The

Help!

I've had some difficulty to help

Craig Pappert with his map of Wootton Bassett. Rick L. Colossal Adventure and Feasibility Expert. Quite a mixed bunch there and although we offer no prizes for such contributions, they are most welcome. Craig is trying to repair the letters in Feasibility Expert and wonders whether anyone else can help him.

S. Gilling has gone out better and sent his map of Colossal. However, this does not include the 70 location and game of Level 9. Part was taken from a DEC machine.

The map is deleted and well drawn - obviously the culmination

of several months' hard graft.

Compass directions are freely used for references, a point often neglected by adventures when they play but reported when they return to the game several weeks later.

Dave Ward would like some facts on Mosaic's Quest. I did not know it was available on the Atari,

books were in the first person and awarded trophies everyone who read them identified with and so an agent became Adrian Mole.

The game is purely an exercise in route finding through a series of sat pages, and the player becomes essentially a reader without the benefit of real involvement.

Often, just as I was getting into a route which appeared to be entertaining, up would come a screen full of text and the game would change direction once again.

I think this is a great shame. We saw what can happen to a comedy classic in Hitchhiker's Guide to the Galaxy. The Secret Diary of Adrian Mole had the same potential. Unfortunately it seems to be left pining comparatively at rest in the bedroom corner.

■ Next month I hope to review a load of new adventures collected for the *Alan Shaw*, as well as writing what is now and trending in the world of Alan.

Glitches of the Month:

Glitch of the Month brings two similar problems in different Level 9 games.

As in *Morden's Desert* breathing underwater features in both *Red Moon* and *Adventure Quest*. In the latter if Watson points out that if you enter the river with nothing, go to the shore, get the fish, cook it, pour something and return to the river you no longer need go through the process of getting

and dropping the fish to be able to breathe in different environments.

■ *Cash* has found in *Red Moon* that once you have the pipes and harness you can wonder for miles underwater without ever having to fix the pipes or worry about them being too short.

Thank you folks, your T shirts are in the post. But so the T shirt for Geoffrey Mottagh, who supplied our December Glitch. Sorry but we've lost your address in the editorial maze. If you contact the office all can be resolved.

BASIC COMPIILER

Part Two of the series by FRANK O'DWYER that helps you speed up your programs

HERE is the second part of the Basic compiler program — the compiler library. You should type it in using the Atari assembler/editor cartridge or compatible assembler, and save it as a cassette by itself.

The cassette and the one compiling the compiler program given last month will be required every time you compile a program.

You don't really know enough about the compiler to begin to write and compile your own programs just so far now let's try to compile the Basic program given as Program 11.

This is simply a demonstration program — don't worry about how it works for now. It produces random sounds and performs until a key is pressed. An assembler's program written in Atari Basic is given as Program 12. You can type this in to compare the speed of Atari Basic with Compiler Basic.

Compilation is essentially a three stage process. First you create your program — this is called editing. Then comes compilation, where the program is translated from Basic into Assembly language. Finally comes assembly and execution. Here you assemble the program and run it. If at any stage you make a mistake you must go back to stage one.

Let's go through the three stages with the example Program 11.

■ Editing

For this you will need a text editor. If you are using the Atari assembler cartridge this is no problem since one is included in the cartridge. If using some other assembler program then you can probably use a text editor for this purpose. If not you will have to beg, borrow or steal a text editor from somewhere.

Type in your program using the text editor — the RUN command of the Atari assembler/editor cartridge can be used to supply automatic line numbering. Type in Program 11 in the way making sure you have the assembler cartridge plugged in since Atari Basic will reset Compiler Basic with system errors.

Type in the program as given. Note that the compiler does not recognize abbreviations such as POS for POSITION and P for PRINT. When sent you have typed the program correctly save it on a two cassette.

Use the LIST+C command of the

assembler cartridge. This saves the program in Atari character form on the cassette and is the only form the compiler will recognize — so if you are using an assembler other than the Atari version you must use an equivalent command. The cassette you have just made will now be referred to as the source program or source file.

■ Compiling

Plug in the Basic cartridge and load the compiler program given last month. Now insert the cassette containing the source program. Don't forget to rewind the tape. RUN the compiler which will prompt you for the source file name. The correct response is C for cassette. Press Play on the cassette drive, and return on the computer as if you were loading a program.

You should see Program 11 being listed out on the screen and the compiler will prompt you for the start address of the Assembly language. The answer to this is really up to you but I suggest 14336 for the example which is the address of the last 2k on a 16k Atari.

Now you will be prompted for the start line number for the Assembly language — almost any number greater than 1000 will do here except under 1000 for now. Almost instantly you will enter 1000 in response to this question — other responses are only required if you want to have more than one compiled program, share the same compiler library, and this is a topic which I will return to in a later article.

The next question to answer is the filename for the Assembly language. Assuming you are using cassettes, the correct answer is C. Before you respond you should insert a cassette ready to take the program which the compiler is about to generate. Press Play and Record on the cassette then Return when you hear the two beeps.

The compiler will display each line number as it is compiled and will finish by telling you how many errors it discovered in your program. If there were none you can proceed to the next step. If there were errors then you must go back to stage one.

■ Assembly

Insert the assembler cartridge and rewind the cassette you have just made. Type ENTER+C to load the

As the memory of Atari II bit computers (necessarily models 400, 800, 1200, 600XL, 800XL and 1300XL) gets larger — it seems that the manual supplied with them gets smaller.

The old 128k Atari 400 computer came with two 104 manuals describing the use of the machine. The latest 128k Atari 1300SE has only a small instruction booklet which does little beyond revealing the permitted Basic key words.

This is a pity because some powerful capabilities are hidden within these machines which are not referred to by any of the manuals nor by the beginners' books supplied by other authors.

The experienced Atari user will doubtless be aware that there are three well-documented text modes (in Basic: Modes 0, 1 and 2) and a further six graphics modes (Basic: Modes 3, 4, 5, 6, 7 and 8). There are also three GTIA graphics modes (Basic: Modes 9, 10 and 11) which can be found in the later models.

The trouble with the text modes which print characters on the screen is that the background colour remains the same for each printed character even though it is possible to alter the colour of the characters themselves.

For example you can print the letter A on the screen in four different colours in text Modes 1 and 2, but the background remains the same for each. Any attempt to change the background colour equally alters the background of all the different coloured characters.

Suppose you want to make a chess board. This requires black and white pieces to be placed on a grey blue and red background squares. Clearly text Modes 1 and 2 are not suitable for this purpose.

However a poorly documented solution exists to this problem. The Atari graphics chip is responsible for all the graphics and text modes known in Basic, but also controls a few interesting extra modes.

These were only accessible in the early Atari computers by writing a custom-designed display list — a sort of machine code routine which called the necessary extra Atari modes. Some of these extra options are now directly available to the Basic programmer who has a 600XL,

A colourful combination

JOHN WHITE demonstrates the way to brighten up your screen display by using Modes 12 and 13

800XL, or 1300SE computer.

Text Modes 12 and 13 in Basic on the latter computers correspond to Atari Modes 4 and 6 respectively from the older Atari machines. They permit text to be printed on the screen in any combination of four colours per character, with up to five colours available on one screen.

Before going any further it is necessary to examine how the Atari display characters on the screen. The main difference between the graphics and text modes is that the former display only a single byte of data by POKEing it onto the screen, whereas the latter takes the character code (such as the corresponding eight consecutive bytes from the character set) and POKEs all eight of the data bytes one underneath another on the screen.

A character therefore comprises eight bytes placed vertically on the screen. Each consists of eight bits, each of which may be set 1, which means that a colour is shown in that pixel, or not set 0, meaning that the background colour is assumed.

The letter A on the 32d character in the Atari character set (Figure 1) shows exactly how the eight data bytes for the letter A are held in memory.

The head of the character set is indexed by memory location 224. Thus the first character in the set has its data bytes stored in memory

locations: $224*256$, $224*256+1$, $224*256+2$, ..., $224*256+7$.

Since A is the 32d character and each character has eight data bytes we must look for the data for letter A from positions $224*256 + 32*8$ to $224*256 + 32*8 + 7$.

You can test this statement with program 1. The results, which are printed out, should agree with those displayed in Figure 1.

```
10 FOR I=0 TO 7
20 PRINT HEX$(POKE(224*256+I,32))
30 NEXT I
```

Program 1

Now try Programs 11 and 12, watching the screen carefully. Program 11 puts the letter A on the

Figure 1 Data bytes for letter A

screen in text Mode 0. Program 11 develops and prints the same letter A in graphics Mode 8 by placing graphics data bytes taken from the character set for the letter A sequentially one underneath each previous byte.

```

16 PRINT "A";PRINT "A";PRINT "A";PRINT "A"

18 NEXT I
  
```

Program 12

We have seen that the letter A can be poked to the screen with the code 30. On colour test screens (Modes 1 and 2) the sixth and seventh bits of code are combined to show the colour of the character.

Since four combinations are available by changing two bits, four colours can be permitted on the screen. Thus repeatedly adding the value 64 to the original character code will change the colour up to four times. Try Programs 13 and 14.

```

15 SCREEN 1
16 SCREEN 0:PRINT "A";PRINT "A";PRINT "A";PRINT "A"

11000000 =	192
11001000 =	208
11110000 =	224
11111000 =	240

Now return to Program 11 and change line 10 to read 100000000000. Run the program. What has happened to the character?

In Modes 12 and 13 the character data bytes are used differently to their role in Mode 0, although a full character of eight bytes is still displayed.

Each different pair of bits in a data byte tells a separate colour register to colour the pixel described by the two bits. Again there are four permutations of two bits — 00, 01, 10 and 11 — so four colours can be permitted in one character byte.

Let's look at letter A again in the light of this information.

00	00	00	00
00	01	10	00
00	11	11	00

01	10	01	10
00	00	00	00

Figure 11: Mode 12 character data bytes

Note that the character is now only four pixels wide, whereas it used eight pixels wide in text Modes 0, 1 and 2. If you have colouring pencils handy colour in Figure 11 with the default Atari colours that:

- 00 = black
- 01 = orange
- 10 = green
- 11 = dark blue

Compare the coloured picture with the screen character. They should be similar, although colour blending on the screen tends to blur the colours.

Now try changing line 30 in Program 11 to 30 POKE 800000000000.

One of the colours of the character on the screen has altered. As was the case in text Modes 1 and 2, changing one of the top bits of the character code has affected a colour register, although in text Modes 12 and 13 only the top bit can be altered.

Table 1 summarises the effect of the character code and the values of the

data bytes on the colour registers used. Use SETCOLOR N to alter the colours, where N is the value of the colour register shown in the table.

Bit Pair	Colour register affected	Character code (code+128)
00	4	4
01	0	0
10	1	1
11	2	3

Table 1

The colour registers can be changed in the ordinary way from Basic with, for example, SETCOLOR 0128:SETCOLOR 154 (assuming 128 is zero).

The character set provided by Atari in ROM is designed for use with text Modes 0, 1 and 2, and is rather useless in text Modes 12 and 13.

However, if the original character set is copied into RAM, individual characters can be altered to give interesting pictures. A machine code utility for copying the set into RAM is given in the Chess Board program at the end of this article.

There is one important disadvantage with the method of displaying multi-coloured graphics characters on the screen. For each character byte which has been modified there is one less of the original character set taken displayed. It is easy to consume part of the original alphabet stored in the character set so that only garbage will be printed out in the text window.

It is possible to divide a single chess piece into four different characters which are then POKE'd on to the screen in this order:

- A
- B
- C
- D

The character data for a chess piece is shown in Figure 12. The code is divided into four characters, each of which has eight associated data bytes. I have given the piece in such a way that each byte is part of a four-bit set of identical bytes. This saves space in data statements in the Chess Board program, but higher resolution could be achieved by making each byte of the pair different.

The program places a chess board on the screen in five colours. When you have finished with it alter the GRAPHICS 12 to line 880 to

MANC

UNAI

THIS game-playing program is basically an exercise in artificial intelligence. Unlike most game-playing programs however, this one is different in that the computer actually learns as it goes along.

The program partly simulates human learning as the computer remembers positions which led it to lose and then given the opportunity plays these back against its opponent.

The game is a simplified version of an Ancient game called Mancala. I chose this game for the exercise because it is fairly challenging while not being too complex and it may also be new to many people.

This simple version is played by two players using eight counters on a 2×3 square board. The game begins with two counters on each square and the players take turns other across the board.

During turns, each player picks up the counters from one square on higher side of the board and moves them anticlockwise round the board putting one counter on to each square in turn until they are exhausted.

Thus if one player picks up three counters from the bottom left square he must put one counter on the bottom right one on the top right and the last one on the top left, leaving no counters on the original square. The winner is the first player to have all eight counters on his/her side of the board.

The program allows you to play against the computer. On your turn move the joystick left or right to choose the square you want to move from, and then press the fire button.

As we start the computer is totally naïve, knowing only the rules of the game. Each time it loses, the computer remembers the position which led it into a losing sequence of moves. In future it will avoid getting into this position itself, but will put you into it if it can.

Humans also learn like this — but

PROGRAM STRUCTURE

10-40	Initial variables and screen
40-140	Player moves
140-200	Generate the computer moves
200-230	Compare distributions for both possible moves by computer
230-400	Computer's move. Random choice unless one move leads to a certain win or a certain loss
470-600	Show position as histogram. If extended as variables
600-700	If computer loses, store histogram as pattern loss. Then compute positions which lead to a win for each of these determine both possible distributions. List of both lead to player's best position as a certain win — for the player. Compute the corresponding position for the computer ($100 = C$, $10 = D + A$) and store as a win
710-790	End of game and initialise for next game
800-880	Subroutine for adding winning positions
880-950	Subroutine for setting up screen
1000-1050	Subroutine for moving counters

MAJOR VARIABLES

SQUARES	The squares are called 1, 2, 3 and 4 anticlockwise from bottom left
A,B,C,D	Number of counters on squares 1, 2, 3, 4 respectively
COORDS(I)	Matrix table called for each position containing pointers concerning position
DEB(I)	Quaternary. Positions are identified by computing $1000A + 100B + C$
DEB1, DEB2	The two possible positions which can arise from the next move
LASTSPOS	Current status code for DEB(1) and DEB(2)
	Last position visited by computer with its telephone coin value

unlike a human the computer learns nothing from winning, nor can it formulate general rules of strategy to guide its play.

Against this however the computer does have the advantage that it never forgets positions which it knows must lead to a loss or those which must lead to a win. It learns rapidly from its mistakes.

After five losses, it is quite a fair player and after 10 it can be difficult to beat. Try playing it the first one to 10 wins, and see who learns quickest.

The program works on the principle of giving a code of 1 to positions which lead to losses and 2 to those that lead to wins. Initially all positions have a code of 0.

Whenever it loses, the computer records the last position it created which had an unknown outcome that

is coded 0. That position is then given a code of 1 so that the computer knows not to create it again.

Next, all possible positions from which that position can be created are computed. If it is found that all moves made from one of these positions lead to losses the position receives a code of 2, so that given the opportunity the computer will create the position, knowing that it leads to a certain win.

In this way, as the number of its losses increases the computer identifies moves leading to losing sequences earlier and earlier and learns longer and longer winning sequences if played against long enough it becomes a perfect player.

THOSE of us who started with DOS 3 and have subsequently changed to the new DOS 3.3 will at some time wish to have a printout of files contained on a disc.

While this was possible with DOS 3 the option seems to be omitted on the newer operating system. You can however get a printout of disc files with Atari Writer but like DOS 3 this presents you with a not too neat flow-etch strip, a bit off if you have an 80 column printer.

This disc index printout utility resolves these problems and allows you to neatly catalogue your disc directories on standard A4 paper. In addition it allows the directory to be named, disc numbers and side identified. The program also automatically records the number of files, the used sectors, and the free sectors.

The program was written on my 1300E but works fine on my 600XL. It was designed for the Atari 1050 printer but works with an Epson FX-80 and should do so quite happily on any other 80 column printer.

As the layout of the directory is dependent on the number of blank spaces in the PRNT statements I've included some ROM statements to help get it right.

They refer to the line immediately following—for example the statement on line 176 refers to the layout of line 100. None of the ROMs are necessary and you can omit those that if you want to save yourself some typing.

programming

The ST machine and ST Logo make learning Logo fun. By working through this book project by project, the reader will explore ST Logo and be able to write programs using sound, text and graphics. Applications from interactive games to custom poetry generators are developed stage by stage. This volume will be of interest to a very wide range of readers from the young novice to the leading professional.

Also with Logo and experience the exciting microworlds and sound and colour provided by ST Logo. **£8.95**

THE YOUNGER SET

This series is aimed at 8 years and upwards.

Unit 1: FIRST STEPS IN BASIC

Starting with the first things every programmer needs to know, you will learn to issue commands to the computer as well as writing and running programs. By the end of it we will have to make your computer perform useful and interesting tasks.

Unit 2: EXPLORING BASIC

This will teach you the most important concepts of BASIC: numeric variables, string variables, FOR, NEXT and IF. THE 4 statements, and much more. You'll create a digital compass, clock, interesting graphics programs and a 2-up tic-tac-toe, video game.

Unit 3: MAKING BASIC WORK

You'll discover how to use the POKE command for the computer's memory. You'll find out about creating in the real world. You'll also learn much more about BASIC including READ, DATA, GOSUB, RETURN and GOTO. By the end of the unit you'll have considerable programming skills.

Maze Munch score

I **ENJOYED** Maze Munch, you find game taking so short. However the score does not increment on a second (or 30000's) when run on the 80000, whereas it would on an 80000.

Is this connected with a bug in the ROM or PER/ASIC, or with a responsibility for unnecessary Atari 2 reports and advice that causes the report back up with total loss of program control?

The value of this address on the 80000 is 80. Is it also on the Atari 2? Are there any 80000's with the bug-free Atari 2? Are any available as I have had problems with a few other (original and commercial) ones?

Clearly, there is a short coming for readers to experiment with, or add to a program.

• Your problem is completely ready to be solved by lack of memory than by the Atari 2 bug. To the best of our knowledge, however, none of the 80000 is on 80000's from Ben C. Reed in Bristol.

This study and table on the 12000 is in cartridge form from Atari Atari dealers. It appears that found different places let us know.

Cartridge port

I HAVE an Atari 400 and am thinking about buying the 12000. Can I use the port if it has a cartridge port or not?

Several problems I have a light pen made by Atari and another which worked on a report on Atari 2. — Ross

Stirling, Dorsetshire.

It only has two joystick ports but then has many four-player games so you know?

The light pen scanning it works with the Atari can be plugged into port 1 or sometimes an older 4000 port 4 — I don't know why.

You can PER boards 504 and 505 to get the ready program. These range from D to 528 but may need a late modification to carry the two and measure points for the edge of your TV set.

Use STICK(0) or STICK(1) to check for the pen button being pressed.

Loading problems

I AM user of Atari 400. The problem is that just as we start to go.

For instance, I bought a pack of 175 (100) cartridges. I bought a program, but it did not load.

At the beginning of loading the program, usually, there is a white dot on the Atari 400's screen. It does not move the dot.

Could you tell me what happens and what to do? — John Beard, Nottingham.

• If your recorder has an

only been used to load games, you may find that your recorder is faulty and will not work although it will load correctly.

Try taking to other users, such as TDK, C&D to see if this is the case.

If you still don't get anything take your recorder back for repair. It does work then your question is answered.

Price of memory

I AM phrasing the effects being made to increase Atari popularity but that the publishers of the 80000 have been lucky for some.

The 80000 has been available for approximately 1750 and yet the memory expansion for the 80000 is not priced at approximately £20.

When Atari say about to make the expansion cheaper for the people who supported the launch of the ST, what?

I think your response is superb and like the answer set with the fact there is no answer.

I would like, though, to make a couple of small points. Please note the inventory requirements when reviewing software and don't spoil the better part of making my score if higher than your score. — B. Hartridge, Birmingham.

K-Spread comments

HAVING just read the review of our program, *K-Spread* for the Atari ST, we would like to state the Atari User we would like to enter a free point bonus in your readers regarding some of the comments made. Some of this information was given to Andre Willey, however it obviously missed being included in the review.

1. Copies of our ST application software are now available, however the data sheet upon to make a back-up copy for day-to-day use. It can also be copied to a hard disc without problems.

2. Two bugs were mentioned regarding the Atari 2000. The first about the Atari 2000 was only present on a few early chips and has since been resolved.

3. The version on sale checks for updates when extensions are made, if no updates are present the user is presented with an option regarding changes.

4. We have an extensive development program underway and are working on a large number of related features. We have a positive upgrade policy whereby users of current versions will be able to upgrade to new versions at minimal cost.

5. Business graphics will be available when the data sheet update program *K-Graph* is released towards the end of this quarter.

I hope you will be able to make the information available to your readers. We will of course keep you updated regarding new and improved products in our ST software range. — Jan Day, Sales Manager, Kuma Software.

• Andre Willey replies: I did get a new copy of the program — but the March issue containing the review was already in the post.

At 10.10.10.10.

That 'k' rating

REQUEST If you might not have noticed advertisements to follow the 'K' rating of the games they advertise - MSX-2000 or otherwise as I have found it an expensive mistake having to write to firms, purchasing an MSX to find out if a game is suitable for my MSX2000.

Also would you please advise me if it is possible to obtain a retail pack to upgrade to MSX 2 I have written to several firms but had no luck as for Master some of the other readers could help me - B. Cottrell, Irvine, Ayrshire. ■ If a shop should have the MSX pack but at present day most you might be able to find an MSX2000 for less.

1020 and Atari Writer

MY reference to the letter from P.C. Jones in the February issue of Atari User I also had problems using the 1020 with Atari Writer after much experimentation I found the following procedures solved them.

Select option 1 when asked for the type of printer. Then Put Col-D27 at the beginning of each instruction in place of the 630 630 in the 1020 instruction manual.

Then type Col-D followed by the Atari number corresponding to the instruction.

For example to change to the red pen instead of typing 630 630 Col-D "C" you would put Col-D 27 Col-D 70374.

Finally put the pen and paper instructions on separate lines. Steven Burke, Bosley Heath.

Attract mode

HAVING bought an Atari 8000, six weeks ago I first moved into a major problem I am wanting to see a computer manager type game which is

coming on line.

The problem is you need to be able to do the same changes between games the program is running. The game is almost identical controlled by a few keys (like Atari User) which does the same thing.

Is there a job or some way of preventing this change of jobs?

I have just changed my Spectrum to buy the Atari and I am determined to see the best after a year of the Spectrum - Steve Kennedy, Stroud. ■ To ensure the store, make you need to PMSX 370 as regular intervals in your program.

Problems solved

I HAVE answers to two questions asked in February's Atari User Magazine - and one question.

Patric McDonald's problem on cassette loading techniques could well be the location of his recorder. If it is within two feet of his TV or monitor the very strong magnetic field generated by the equipment will often corrupt data stored on magnetic tape. I had the same problem and relocating the recorder away from the TV solved it.

My reply on my not being able to salvage the existing after market unit for my Atari 8000 was a bit off.

Mr A.C. Parney's question on Bridge programs for the Atari is fairly answered. I have two 600 in Aberdeen and see the 6000 advertisement which should present no difficulty to be experienced players.

They each require a keyboard for data entry and one of them says some installing immediately.

With my wife and I keep us positive by regularly playing bridge with our Atari. It doesn't look after or pay when it does!

One program is by Amstar the other by GNC. I got them in the 60 but I am sure they are available here from Software Express or Slide Shop.

If anyone needs more information they can call me

on Taverham, Norfolk 2000.

My question is when are we going to see a RAM disk add-on for the 8000, to reach the 128K and when the software writers going to take advantage of this facility to write more powerful and efficient disk programs?

Also I am looking for an 80 column word processor - I am tired of my 40 column Asquith!

On last shop. Would you please give a copy to MMR - the Taverham MMR Atari Group - A.C. Parney, Charnock, Taverham, Norfolk.

Not worth changing...

AS a prospective Atari buyer and a current Commodore 64 owner I am very interested to read in the February issue User of the difficulties some of your readers have experienced with their Atari computers and

herefore particularly about the reader who complained changing to Commodore.

This is because since buying my Commodore 64 in August 1984 I have had to change at least twice due to faults with the computer or having accessories.

The C64MS4 I finally came to develop a fault with as SD chip and had to be sent to repair costing seven weeks.

On the day I received it back and having also bought a new drive I connected them only to find the computer would not work with the new drive.

I had to wait 12 weeks for the computer to be repaired.

I hope your readers will see that it is not just Atari who have problems and that I share those fears seeing then the prospects of other computer manufacturers' loss of goodwill. Unfortunately - Benji Mohamed, London Reg.

SOFTWARE FOR THE ATARI ST

METACOMCO PRESENTS ITS NEW RANGE OF SOFTWARE FOR THE ATARI ST: A SET OF POWERFUL PROGRAMMING LANGUAGES FOR PEOPLE WHO WANT TO WRITE PROGRAMS FOR THE ST.

► *MACRO ASSEMBLER*

£49.95

A high specification macro assembler, complete with linker and screen editor. Assembler is a fundamental language, useful for all kinds of programming - particularly where speed and compactness are important. Essential for all serious programmers who want to exploit the ST's full potential.

► *MCC PASCAL*

£39.95

A powerful Pascal compiler designed to meet the exacting ISO standard. This Pascal is already widely used on the Sinclair QL and the Commodore Amiga. A fast, single pass compiler, generating native code. Full interface with GEMDOS libraries allows windows, icons, menus, etc. to be programmed using Pascal. Complete with screen editor and an extensive user manual.

► *LATTICE C*

£39.95

The well known Lattice C compiler, a full Kernighan and Ritchie implementation with comprehensive libraries of UNIX and utility functions and including a complete interface to GEMDOS features. C is the ideal language for program development.

ALL METACOMCO'S LANGUAGES FOR THE ATARI ST INCLUDE METACOMCO'S POPULAR SCREEN EDITOR, AND A DETAILED MANUAL.

► Metacomco are leading suppliers of systems software for 68000 based microcomputers. As well as these titles for the Atari ST, Metacomco have a very successful range of programming languages for the Sinclair QL, now widely used throughout the world. Metacomco was also chosen by Commodore to provide the operating system and a suite of languages for the new Amiga computer.

Megabyte ST released in UK

MIKE COWLEY reporting

ATARI'S Big One — the one megabyte ST — has finally taken its bow in the UK and so too has its little brother: the cut-price version of the 520ST or 520STX.

The news of the twin launch was greeted by local manufacturers with all the enthusiasm of the local hard man finding himself matched against Fosse Bouse and Barry McGuigan at one and the same time. For at their respective levels the 1040ST and the 520STX are likely to prove to be knock-out specialists.

Weighing in with one megabyte of memory the 1040ST appears to be in a class of its own at the moment in the micro-knapsack division. It comes with a built-in one megabyte disc drive, mouse, integrated operating system, internal power supply and choice of either a 12in black and white high resolution or 14in colour monitor.

And Atari has given it that extra Hammer quality by fixing its price at less than £1,000.

This isn't just going to knock them over it's going to leave them for dead — started an Atari spokesman with all the venom of a right-chaining boxing promoter.

If that wasn't enough, the Jack Torrance training camp has broken up at the same time: the 520STX, the machine they predict is set to become the people's champion in the 16 bit market.

A stellar clone computer, it is really the unbundled version of the 520ST with built-in operating system, mouse and internal modulator.

Though the price of this little bruiser had still to be fixed as we went to press — the weakness of the dollar forcing last-minute revision of calculations — it is expected to fix its muscles in the region of £300.

REPORTS from West Germany say that Atari is working on a Unix system and a co-processor card for the ST series. German news agency-CW Communications quotes Atari executives as announcing development of a 32-bit co-processor extension incorporating a 32-bit Motorola chip and having a 2-mbyte — expandable to 4-mbyte — onboard Ram.

The co-processor unit is expected to make its debut later this year with the Unix version of the ST entering the market in 1987. *Information sources close to Atari have been quoted as*

Atari's 520

saying that the unit will cost between \$500 and \$600.

TWO new software packages for the 520 ST have been developed by Quest International Computers. The Prolog Fast Basic II and Compiler offers programmers the facility to port existing applications to the Atari Basic II using

Quest Prolog

compatible with Microsoft Basic £99.95.

For the business user Quest has ported its Cash Trader program to the ST. Priced £99.95 the software offers windows for entering reporting and help screens.

WORLDWIDE distribution of Atari ST software has been undertaken by Autodesk, who intend using their vast network to markedly increase the company's base. Versions of two of their sales Hisher and Macintosh will shortly be out for the ST.

these general purpose cables if they don't work with your particular set-up.

Richard Chubb of Worthing has discovered a bug in the ST's Basic. The problem lies in Basic's GOTOSY command. Program IV illustrates the problem perfectly. The Xs generated by the program are supposed to be next to each other. The problem is that GOTOSY doesn't use the correct X coordinate. This makes reworking difficult.

The only solution that I have been able to find is to use the TAB function instead of the X coordinate. The main problem with this method is that TAB writes over characters to the left of the cursor with spaces. Therefore you have to place characters on the screen from right to left. Program V shows this solution.

Several of you have complained of the lack of software for the ST. This is a perennial problem where new machines become available that previously have little or no software.

At this stage, the only people who should buy them are computer freaks like myself who can have fun using a computer without necessarily being able to do any useful work with it.

Often however, people who want to do some work with their machine are pulled into the hype and buy a machine that has very little software actually as the shop shelves.

The 520ST – and the Apple Macintosh before it – suffered heavily from this. The ST might be one of the easiest computers to use with its mouse, menus and windows but it's difficult to get to grips with it from a programmer's point of view.

This means that the first few programs that have appeared have not used the Gem interface and have looked like they were running on a toyboxed based IBM rather than a mouse based ST. It has taken several months for the software companies to come to terms with the ST.

Hopefully by the time you read this, good quality software will begin to appear in quantity. Programs such as *Benjamin* (included's DBASE) show what can be done. If you are disillusioned for your ST has waited during the last few months now is the time to restore your fire and come out fighting armed with your ST.

With the announcements from Atari of new ST machines on the way Mr Kowal of Milton Mackway is wondering whether or not to wait before buying an ST.

Last month in *Atari ST User* we told you that Atari had announced a 1Mb version of the ST (1040ST) for £1 000 B&W or £1 300 for colour and a 7M modulator version of the 520ST for about £400. The current ST package sells in the States for \$800 B&W and \$1 000 colour. This

means that the 1040ST is likely to cost £250 B&W and about £1 080 colour and the modulator 520ST will probably cost around £350 (without a much needed disc drive).

I don't think the basic (modulator) version will ever arrive in the UK, but the 520ST FM is much more likely with its built-in drive. The 520ST FM will probably cost around £450. The present 520ST will probably drop in price to around £300 for B&W.

Should you buy now or wait? First ask yourself

HINTS

★ The file selection section of most ST programs is easy to use. You simply point at the file that you want and then click on OK. The only problem arises when your file is on a different disc from the program.

To load in the directory of another disc is quite easy. After the file selection box comes up on the screen change the disc in the drive and then click once on the top of the small window which contains the file listing. The new disc's directory will now be read in.

You must always use this method when changing discs as changing discs without reselecting the directory might lead to your discs being corrupted and unusable.

★ The latest batch of free software from Atari comes on three discs. If you take a careful look at them you will notice that *Megazilla*, *Doodle* and *BBW* can easily fit on to one disc. If you move *Megazilla* and *Doodle* on to the *DBMaster* disc you can then erase the *Megazilla/Doodle* disc and Atari has supplied you with a free blank disc.

★ If you are having problems with *STWriter 1* reformat the disk you transfer to the new Atari word processor *FastWord*. It is far easier to use and can also be used to edit *Basic* and C programs.

whether or not you need 1Mb or 7Mb of memory, the newer 520STs will have Gem in ROM and therefore have about 480k for programs. Only software developers and large businesses will need 1Mb or 7Mb of memory.

My advice is to wait until the new machines arrive, remembering that the 520STFM is probably a non-starter and then buy the machine that you think most suits your needs.

You will be able to add a monitor to the modulator STs if you should wish to. The B&W monitor costs around £150 and the colour around £400. If you should wish to upgrade to 1Mb or 7Mb at a later date several companies are about to offer upgrades for the 520ST for about £150.

★ What a lot for one Atari month! I'll be covering your problems and dealing with any advances in the *Atari User* *Stave*. In the meantime I'd like to hear your opinions on the new ST machines.

Modula-2 for compact code

A 68000 computer needs good languages to utilize all of its capabilities. The Atari 520-87 is one of the newest and best computers on the market today. Now TDI, a British software company, has released Modula-2 for the 87, and it is a fine example of what a good language should be.

First let me explain what Modula-2 is for those that have not heard of it yet. Niklaus Wirth, the inventor of Pascal, also invented Modula-2. The language is an addition to Pascal and has these five added features:

- The module concept, and in particular the ability to split a module into a definition part and an implementation part
- A more systematic syntax which facilitates the learning process, in particular every structure starting with a keyword also ends with a keyword, so it's properly bracketed
- The concept of process as the key to multi-programming facilities
- So called low-level facilities which make it possible to insert the real type consistency rules and allow you to map data with Modula-2 structure onto a store with inherent structure
- The procedure type which allows procedures to be dynamically assigned to variables

TDI's Modula-2 compiler implements the full Modula-2 language as described by Wirth. It includes separate compilation, output types, co-routines (pseudo-concurrent processes) and floating point routines. It is integrated into the Gem environment and will support all the Gem routines. It also promises to make compact code.

As in all high-level languages the Modula-2 package comes in three parts - an editor, a compiler and a linker in a two disc package. There is no copy protection on any of the discs and you can arrange the system to fit your convenience. A good demonstration of the power of Modula-2 is included. Since most programmers do not spend much time with either the compiler or the linker, the editor is the most important part of the package. The one is very user friendly and powerful.

The full screen editor uses both the mouse and

the function keys. You can point the mouse to the spot where you want to work and click it. This will be the new spot where writing begins. Using the function keys you can move one word right or left, page up and down, and move a line up and down.

The arrow keys are also used to move around the screen. The deletion function works similarly as the movement functions, with the ability to delete character right or left, word right or left, or line right or left. You can undo with the Undo.

For large insertions or deletions, you can Mark and Cut or Paste text into the proper spot. These shortcuts are available both with the mouse and drop down menus, as well as using the function keys.

One more function is unique to this editor. After a program is written it is compiled. Most of the time there are errors in the compilation and with this compiler the errors are written to a file on the day. When you return to the editor the error file and your original file are combined so that there are little files where the errors occurred.

All the errors in the program are examined. There is even a special function key for looking for the next *if*. When the cursor is moved to the spot a message will be shown at the bottom of the screen with the error number. The error number can then be looked up in the table in the Modula-2 book.

There are four pages of possible errors, and they are well defined so it is easy to correct them and continue. The listing of the error messages in a file that is merged into your file shows the text and effort that went into making the fix package. The editor was, of course, written in Modula-2.

Figure 1 shows a sample program in Modula-2 and you can see the various differences between it and Pascal. Firstly, there are two parts to the program: a definition module and an implementation module. There is a difference between what a programmer does and what the outside world sees of the program. You must define what will come out of the module

Atari 520ST

Write GEM software for your Atari 520ST NOW!

TDI present TDI Module-2/ST, the only Module-2 compiler for the Atari 520ST. Accessed through Atari GEM icons and driven by mouse, icons or keyboard input.

TDI Module-2/ST

£99.95

The package: TDI Module-2/ST comes complete with its own screen editor, linker and friendly GEM illustrated manual.

Speedy error detection: The compiler is integrated with the editor in such a way that all compilation errors are stored and displayed one after another on the screen for the programmer to correct.

Write GEM programs: The full GEM interface and graphics are supported by TDI Module-2/ST. GEM software can be developed with windows, mice, menus and graphics.

Advanced user friendly language: TDI Module-2/ST is the logical development of the Pascal language. Pascal programmers will take only a few days to adjust. It is a highly productive language producing fast, quality 32 bit machine code.

The Ultimate Communications Package incorporating COLOUR PRESTEL **MEGATERM** by Sunsoft Systems ...

*Read this and see if you agree that MEGATERM
is the best terminal programme available anywhere.*

Megaterm consists of a system module for any modem, a very comprehensive manual and a terminal programme which complies in assembly language. It is available on disk or cassette.

The programme has the following features: Colour Prestel (available in Australia since July 1988) the ability to save current screen or a later date as well as the ability to do text or graphics printer dumps of screens. Teletextware downloaded capability is supported as is automatic log-on to Prestel and the colour may be toggled off or on.

You may have a choice of full or half duplex, five parities and six baud rates up to 9600 bps. ASCII and EBCDIC translation modes and wordwrap are available. Disk options (supporting drives 1 to 8) include detectors, rename, load, unload, format and copy file which supports single and multiple drive opens, logons D and C of DOS. Copy file also supports wild cards and the append function.

The programme has a complete implementation of XModem file transfer protocol including block checking and supports all the baud rates including 1200/75 and 75/1200 bps. Subscribers up to a full disk may be uploaded or downloaded as opposed to files.

A comprehensive set of macros is available. Macros can be defined or altered in the Macro Edit screen and saved or loaded from disk. Any one of ten macros may be sent at any time in Terminal mode by a single keyboard Macro can be up to 84 characters long and may be altered to give any macro of up to 840 characters. The screen colours and text intensity are adjustable and should you not like our default values you may change the values e.g. baud rate, parity, translation mode, colours etc and save to a configuration file. At the next power-up your new default values will be installed. Configuration file also gives the file choices in use at that time.

It is possible to make a split screen off line editing screen with independent scrolling. The programme also supports various screen size, rate, configuration of your printer for graphics dumps and full screen messages in default. The menu screen, windows, all present parameters.

Every terminal screen shows the translation type, condition of Marbles (keyboard) buffer, a readable real time clock, number of bytes left in the buffer and the readable screen time. All these values are shown independent of the scrolling ability of the screen. You may store any data in memory or on a file from disk at any time.

The available buffer is 17 000 bytes (compare this with other programmes) and the programme supports the 8086 disk of the 1208L allowing an effective increase in the buffer size of 54K, for the 86. File transfers longer than memory are possible as well as protection of data in the Marbles buffer during file transfers. Forced breaks may be used at any time in terminal mode and terminal screens are not cleared when moving to and from the menu screen.

Sunsoft Systems has a replacement policy for damaged data and offers updates at minimal costs to registered owners. There is a three month guarantee on the editor.

Join all our owners including the school systems by buying the fastest selling Atari programme ever in Australia. Try us you won't be disappointed.

Now here is think about the features and compare the price. It is possible for you to put together a whole system at a far cheaper price than our competitors and you get a full communications package and not just Prestel. You can probably now see why Megaterm is a fast selling product.

Midi message from the hills of Wales

Finding Midi software for the 520 is like looking for an arbutus in a monastery. Having been foisted numerous times by various sources I turned despairingly to a vague contact in the remote Welsh hills by the name of Adrian Wagner.

It turned out to be a scoop. Adrian is developing something that will shake up the electronic music business (he's up to bedtime—he is using the 520ST as the basis of a 16 bit resolution sampling system).

We talked at sampling in last month's *Amiga ST User*. A sound is recorded through a microphone and stored digitally in the computer's memory. Depending on the software, the sound can then be edited using graphics sent back from instrument—usually a keyboard—and played back at any pitch.

A range of samples use popular 8 bit voices. The Bufile Ranges of sampling, however, are the Sincrowave and Fairlight, costing £55,000 and £35,000. They use 16 bit processors which greatly increase the sound quality. An 8 bit system can only sample 256 levels of dynamic change. A 16 bit processor can sample over 65,000 characteristics of a sound.

Adrian Wagner's system will use the full 16 bit capability of the 520ST to produce a sampler comparable to the Fairlight and Sincrowave—and cost less than the present 8 bit packages. According to Adrian, the sampling frequency to scanning rate is the same as that of a Philips Compact Disc. This means the quality of sound recording will be superb.

The software will allow the sound to be displayed and edited on the screen. The waveform of the sampled sound will be displayed ready to be edited with the mouse. For example, you could record a thunderclap and decide you didn't like the high edge. Altering the wave shape on the screen will alter the sound played. There will be facilities to loop a note, to make it longer, delay, reverberate and echo sounds. You will also be able to record a sound and play it backwards.

Adrian complained about the ST's operating system. "It's full of bugs. Some of them make it difficult to talk to the ports. When it finds an error 100,000 instructions appear on the screen." The operating system was probably written by an old hippy high on magic mushrooms.

My enthusiasm restored, I made a final

attempt to get in touch with Island Logic which had claimed the previous week it no longer existed. This time I was told it had now been reorganised and was busy preparing music software for the 520ST.

Island's package is due sometime this year. It is based on Island's Music System for the BBC Micro and Commodore 64, but will use the ST's 16 bit muscle to produce a much higher quality sound. Pull down menus and graphics environment will make the software easier to use.

The Music System will feature a keyboard

The quality of sound recording will be superb

emulator which allows you to use the 520's keyboard as a substitute for a musical keyboard. You play on queries instead of Staccato. Notes will appear as you play them on notes on the screen. The system will record your notes in real time, whether played on the ST keyboard or a Midi connected instrument.

There are six parts to the program, including the keyboard emulator and instrument connector module. An on-screen editor will display and record notes as they are played. You can then edit the final score using the mouse. Notes will be picked up and dropped on the chosen line. Music will be manipulated and edited in the way text is edited by a word processor program.

One of the Music System's most exciting features will be the synthesiser module. It will display a sound's characteristics graphically and allow the voice to be altered on screen by editing the ADSR graph and wave shape. The system will include a library of pre-defined voices which can be edited in the same way.

Music System will also contain a mixing desk. This will enable tracks to be mixed, faded and edited between different voices. Island's Adrian Root said there will be the potential to mix an almost infinite number of tracks. The only limitation will be the output system.

The system will connect to a printer. This will

Anthony Ginn hunts for Midi software for the 520, — and finds there's not a lot of it about

visible musical score to be dumped onto paper. It will also feature a simple word processor to add and edit lyrics with the score. Music System's modules will communicate with each other. A voice created on the synthesizer can be played on the keyboard emulator or an external MIDI instrument. The score recorded and edited on screen (lyrics added) and the final score dumped onto paper.

Music System sounds like it will be a comprehensive low priced package ideal for the beginner. As soon as it's available we'll do a proper review. Apparently Steinway is releasing a similar package for the ST as America calls Music Studio, so I should better get that MIDI out before the competition arrives.

Soon after these references the Editor told me he had just got a \$200 Music Studio package from Steinway. The Church also is a Music recorder package. It arrived on Friday, but I had to get married. It needs a megabyte of memory, no car broke down. (They still haven't sent me £101

options) — to recorder, copy tracks, merge block, brass track, brass block, set delay, delay info, shift from and shift to.

To recorder puts the ST into the recording mode. A tape minus recorder lets you decide which tracks to record on. Clicking the right mouse button will start recording. Undo stops recording and the recorded track will appear under the master Play.

It wasn't until from the documentation whether the program will record 8 or 16 tracks. The block of tracks/master record can be rewound or moved on by holding the mouse button down when the pointer is over the rewind or fast forward icon. Eight tracks are displayed simultaneously on the screen. Each has fast forward and rewind icons and a digital counter to show where you are on the tape. The software turns the \$200 into a digital recorder. Portraying the functions in tape recorder language makes it easy for understand digital recording and making the package accessible and useful be released as soon as possible.

It looks like two types of music software will appear over the next few months. Packages like Steinway Music System and Steinway's Music Studio will be for the home user interested in making music. They will be inexpensive and do a lot of everything — recording, graphic editing of notes and scores, keyboard emulator and simple mixing.

More specialised systems like the Durell recorder and Welch sampler will appear for professional musicians. They will use the full power of the more to perform a specialised job. Many professional musicians, and sound engineers will use the \$200 as a dedicated digital music system. Alan ST (M) will keep you up to date with developments.

Midi synth, I ran out of time. I had a headache and we had a power cut so I haven't been able to play around with it yet.

The preliminary documentation indicates that it record like a conventional multi-track recorder with extra options. There are five pull down menus. One is entitled Midi and contains the

KSPREAD Spreadsheet

£49.95
inc. VAT

An easy-to-use spreadsheet enjoying the benefits of the new friendly GEM system with its mouse driven menu selection and multi-window presentation

- Up to 8 display windows
- Data entry and edit windows with full Function Editor
- Column widths easily adjusted
- Columns/rows easily deleted/controlled
- Delete cell or group of cells
- Copy cell or group of cells
- Clipboard for moving cell or group of cells
- Multiple Drop Menus: 1. File operations 2. Options: sorting, 3. Easy Printer Control 4. Global/variable double delete or overwrite commands

This professional package combines full use of the ST's large RAM capacity with its fast processing speed and facilitates easy data transfer with the K COMM communications package and the forthcoming database and word-processing packages

KSEKA Assembler

£49.95
inc. VAT

Sixty-eight K Assembler - The fast and easy-to-use assembly system for the generation and analysis of 48000 code programs, combining full use of the ST's large RAM capacity with an impressive list of useful features

- Editor - Asm compatible line editor
- 48000 Macro Assembler - Up-to-256 macros, reworking, 3200 instructions, absolute or relocatable code
- Linker - Combines real relocatable object files
- Disassembler
- Machine Monitor/Debugger - Includes: Single step, breakpoints, memory inspect and modify
- Operating system - Dos
- Long labels - in excess of 8 characters
- Size of MASM - 17 bytes
- Source/Display - Fully supported on all modes
- Conditional Assembly operations supported

KRAM RAMDisc

£29.95
inc. VAT

Enables use of more RAM discs with an up to high speed "Buggy disc". The spectacular improvement is in the speed of file handling and transfer - files are accessed and written in between 40 and 80 bytes/byte

KCOMM Communications

£49.95
inc. VAT

This superb package turns the ST into a easy-to-use and configure terminal. Operating under the GEM environment, all the normal parameters can be changed very easily and subsequently saved permanently. Its impressive features include

- Terminal Configuration
- Options for Printer control
- Screen dump
- Input buffer dump and "Back" instructions
- File handling
- Test file transfer options
- Random file transfer with error checking
- On-line access to disk directory
- "Interrupt" - VT 52 and VT 100 emulation
- Local rates from 75 to 9600 baud
- Odd - even or no parity, 7 or 8 bit words 1 or 2 stop bits
- Handshaking as a local or the RS-232C, serial or serial
- Screen width of 80, 94 or 40 characters
- Full display or full display operation
- "DIRTY" mode
- User defined function keys and keyboard layout
- On screen HELP pages

The ATARI ST Explored

by John Rogers

£ 8.95 inc. VAT

This comprehensive guide to the Atari ST gives potential purchasers of the ST an invaluable guide to the capabilities of the ST and will give owners guidance to enable them to get the most from this remarkable system

Topics covered include GEM, DOS, the BIOS, ST files and LOGO with an up-to-date coverage of 48000 assembly code giving useful information including details on system variables and operating system calls to the BIOS. There are also instructions on how to configure the keyboard and utilize the Serial Interface to connect the ST to printers, electronic mail services and other computers

The book is fully illustrated with diagrams and examples, making it easy to follow, and understand. This book is essential to anyone using, or considering using, an Atari ST
